1.

Suppose your training examples are sentences (sequences of words). Which of the following refers to the jth word in the ith training example?
○ $x^{(i)<j>}$

Correct

We index into the ith row first to get the ith training example (represented by parentheses), then the jth column to get the jth word (represented by the brackets).

○ $x^{<i>(j)}$

○ $x^{(j)<i>}$

○ $x^{<j>(i)}$

✔ 1 / 1
points

2.

Consider this RNN:

This specific type of architecture is appropriate when:

○ $T_x = T_y$

Correct
It is appropriate when every input should be matched to an output.

○ $T_x < T_y$

○ $T_x > T_y$

○ $T_x = 1$

✔   1 / 1
points

3.

To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

←   **Recurrent Neural Networks**   **9/10 points (90.00%)**

     Quiz, 10 questions

$$\hat{y}$$

$$a^{<0>} \rightarrow \boxed{} \rightarrow \boxed{} \rightarrow \cdots \rightarrow \boxed{}$$

$$x^{<1>} \quad x^{<2>} \qquad\qquad x^{<T_x>}$$

☐   Speech recognition (input an audio clip and output a transcript)

Un-selected is correct

☐   Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment)

Correct
Correct!

☐   Image classification (input an image and output a label)

Un-selected is correct

☐   Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender)
Correct
Correct!

     points

4.

You are training this RNN language model.

← **Recurrent Neural Networks**   **9/10 points (90.00%)**

Quiz, 10 questions

$$\hat{y}^{<1>} \quad \hat{y}^{<2>} \qquad \hat{y}^{<T_y>}$$

$$a^{<0>} \rightarrow \boxed{} \rightarrow \boxed{} \rightarrow \cdots \rightarrow \boxed{}$$

$$0 \qquad y^{<1>} \qquad y^{<T_y-1>}$$

At the tth time step, what is the RNN doing? Choose the best answer.

○ Estimating $P(y^{<1>}, y^{<2>}, \ldots, y^{<t-1>})$

○ Estimating $P(y^{<t>})$

◉ Estimating $P(y^{<t>} \mid y^{<1>}, y^{<2>}, \ldots, y^{<t-1>})$

Correct
Yes, in a language model we try to predict the next step based on the knowledge of all prior steps.

○ Estimating $P(y^{<t>} \mid y^{<1>}, y^{<2>}, \ldots, y^{<t>})$

✔ 1 / 1
   points

5.

You have finished training a language model RNN and are using it to sample random sentences, as follows:

←   **Recurrent Neural Networks**

Quiz, 10 questions

$\hat{y}^{<1>}$ $\hat{y}^{<2>}$ $\hat{y}^{<3>}$ $\hat{y}^{<T_y>}$

9/10 points (90.00%)

$$a^{<0>} \longrightarrow \boxed{a^{<1>}} \rightarrow \boxed{a^{<2>}} \rightarrow \boxed{a^{<3>}} \rightarrow \cdots \longrightarrow \boxed{a^{<T_y>}}$$

$x^{<1>}$ $\hat{y}^{<1>}$ $\hat{y}^{<2>}$ $\hat{y}^{<T_x - 1>}$

What are you doing at each time step t?

○ (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.

○ (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step.

○ (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass this selected word to the next time-step.

◉ (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{<t>}$. (ii) Then pass this selected word to the next time-step.

▲

Correct
Yes!

points

6.

You are training an RNN, and find that your weights and activations are all taking on the value of NaN ("Not a Number"). Which of these is the most likely cause of this problem?

○ Vanishing gradient problem.

◉ Exploding gradient problem.

▲

Correct

○ ReLU activation function g(.) used to compute g(z), where z is too large.

○ Sigmoid activation function g(.) used to compute g(z), where z is too large.

← 7. Recurrent Neural Networks   **9/10 points (90.00%)**

Suppose you are training a LSTM. You have a 10000 word vocabulary, and are using an LSTM with 100-dimensional activations $a^{<t>}$. What is the dimension of Γ_u at each time step?

○ 1

◉ 100

Correct

Correct, Γ_u is a vector of dimension equal to the number of hidden units in the LSTM.

○ 300

○ 10000

✖   0 / 1
         points

8.

Here're the update equations for the GRU.

GRU

$$\tilde{c}^{<t>} = \tanh(W_c[\Gamma_r * c^{<t-1>}, x^{<t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[c^{<t-1>}, x^{<t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[c^{<t-1>}, x^{<t>}] + b_r)$$

$$c^{<t>} = \Gamma_u * \tilde{c}^{<t>} + (1 - \Gamma_u) * c^{<t-1>}$$

$$a^{<t>} = c^{<t>}$$

Alice proposes to simplify the GRU by always removing the Γ_u. I.e., setting Γ_u = 1. Betty proposes to simplify the GRU by removing the Γ_r. I. e., setting Γ_r = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

○ Alice's model (removing Γ_u), because if $\Gamma_r \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.

This should not be selected

No. For the signal to backpropagate without vanishing, we need $c^{<t>}$ to be dependent on $c^{<t-1>}$.

○ Alice's model (removing Γ_u), because if $\Gamma_r \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.

Betty's model (removing Γ_r), because if $\Gamma_u \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.

Quiz, Betty's model (removing Γ_r), because if $\Gamma_u \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.

✓ 1 / 1 points

9.

Here are the equations for the GRU and the LSTM:

<div style="display:flex; justify-content:space-between;">
<div>

GRU

$$\tilde{c}^{<t>} = \tanh(W_c[\Gamma_r * c^{<t-1>}, x^{<t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[c^{<t-1>}, x^{<t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[c^{<t-1>}, x^{<t>}] + b_r)$$

$$c^{<t>} = \Gamma_u * \tilde{c}^{<t>} + (1 - \Gamma_u) * c^{<t-1>}$$

$$a^{<t>} = c^{<t>}$$

</div>
<div>

LSTM

$$\tilde{c}^{<t>} = \tanh(W_c[a^{<t-1>}, x^{<t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[a^{<t-1>}, x^{<t>}] + b_u)$$

$$\Gamma_f = \sigma(W_f[a^{<t-1>}, x^{<t>}] + b_f)$$

$$\Gamma_o = \sigma(W_o[a^{<t-1>}, x^{<t>}] + b_o)$$

$$c^{<t>} = \Gamma_u * \tilde{c}^{<t>} + \Gamma_f * c^{<t-1>}$$

$$a^{<t>} = \Gamma_o * c^{<t>}$$

</div>
</div>

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to _____ and _____ in the GRU. What should go in the the blanks?

○ Γ_u and $1 - \Gamma_u$

Correct
Yes, correct!

○ Γ_u and Γ_r

○ $1 - \Gamma_u$ and Γ_u

○ Γ_r and Γ_u

✓ 1 / 1 points

10.

You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as $x^{<1>}, \ldots, x^{<365>}$. You've also collected data on your

dog's mood, which you represent as $y^{<1>}, \ldots, y^{<365>}$. You'd like to build a model to map from $x \rightarrow y$. Should you use a **9/10 points (90.00%)**

Unidirectional RNN or Bidirectional RNN for this problem?

○ Bidirectional RNN, because this allows the prediction of mood on day t to take into account more information.

○ Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.

◉ Unidirectional RNN, because the value of $y^{<t>}$ depends only on $x^{<1>}, \ldots, x^{<t>}$, but not on $x^{<t+1>}, \ldots, x^{<365>}$

Correct

Yes!

○ Unidirectional RNN, because the value of $y^{<t>}$ depends only on $x^{<t>}$, and not other days' weather.
